

# Let's not argue about solutions that are not alternatives.

Today, wind and solar account for less than 2% of America's power generation. And while we all want that number to grow, even the most aggressive renewable energy plans demonstrate a long-term need for a 24/7/365 alternative fuel workhorse.

Natural gas is that alternative. It burns nearly 50% cleaner than coal and can make massive improvements in energy security. Most importantly, new shale basin discoveries result in natural gas resources amounting to more than a 100-year supply. All within the borders of America.

**Natural gas. America's alternative fuel for the future, standing ready today.**
